

Acc. Nr.: AW0104953

These unusual conditions have brought spacesuits into being. They protect man from unfavorable action by the space milieu, but they are not the best "special clothing" for hard work. In trying to carry out in space even an uncomplicated production operation--removing a camera from the surface of Voskhod-2--I used far more energy than would be needed on earth. The reason I had to overcome the well-known rigidity of the spacesuit, which is under a certain internal pressure. Thus, fatigue comes more quickly to a man in a spacesuit. Hence the necessity for alternating labor with relaxation. Working out a production regimen is a new problem facing science. The scientific organization of labor--in space--is not such a far-off matter. Everything will be as on earth--both safety equipment and labor protection. So that the difficult activity outside the earth will bring about the appearance of new and cosmozized fields of knowledge.

Today, one of the problems is comprehension and assessment by the cosmonaut in space of time and space and the formulation in this respect of special methodology. Without a knowledge of this, one can scarcely talk seriously even in passing about the productive activity of man in circumterrestrial space. Together with physician Vladimir Lebedev, I attempted to answer these questions in a book published by the Nauka publishing house.

But the most important thing, as always, is experience and the acquisition of skills. The group spacewalk by Yevgeniy Khrunov and Aleksey Yeliseyev and their fulfillment of a considerably greater volume of work--they were in open space for about an hour--considerably broadened our knowledge in this field.

All that I have told you is not in the remote future. Space, in time, will become filled with innumerable artificial "oases" in the form and likeness of our mother--the planet earth.

"High-Refractory Materials on a Zirconium Dioxide Base Stabilized by Yttrium and Aluminum Oxides"

Moscow, Ogneupory, No 4, 1973, pp 42-45

Abstract: An account is given of investigation results of a refractory material of zirconium dioxide stabilized by combined additions of yttrium and aluminum oxides. Dilatometric analysis results of specimens with and without Al_2O_3 additions are discussed by reference to linear thermal expansion curves of zirconium dioxide and its solid solutions. The synthesized material, containing from 90 to 93 mol.% ZrO_2 , from 3.5 to 5 mol.% Y_2O_3 , and from 3.5 to 5 mol.% Al_2O_3 , possessed a lower average thermal expansion coefficient and a higher heat resistance in comparison with binary solid solutions of $ZrO_2 - Y_2O_3$ and $ZrO_2 - CaO$ systems. Some physico-technological properties of the synthesized material were determined. It possesses, like zirconium-yttrium solid solution, ionic conductivity; its refractoriness is 2400-2450 °C. One figure, seven bibliographic references.

"Monopulse Radar"

Monopul'snaya radiolokatsiya (cf. English above); Moscow, "Sov. radio", 1974, 392 pp., Ill. 1 r. 23 k. (From RZh-Radiotekhnika, No 10, Oct 70, Abstract No 1099 W)

Translation: The book deals with various problems of monopulse radar. Consideration is given to principles of design and basic functional elements of monopulse direction finding systems, and problems of precision and resolution are analyzed. Theoretical problems of computer simulation of monopulse systems are outlined, and the interference stability of monopulse direction finders is analyzed for various kinds of interference. Fields of application are described, and the basic tactical and technical characteristics of some monopulse radar sets of non-Soviet design are presented. The book is written for engineering and technical workers and upperclassmen in colleges and universities majoring in the field of radar technology, 166 illustrations, ten tables, bibliography of 134 titles. Resumé.

"Some Characteristics of Metabolism in the Myocardium After Acute Blood Loss Under Conditions of Hyperbaric Oxygenation"

Moscow, Kardiologiya, No 5, 1971, pp 140-142

Abstract: Rats were bled for 30 minutes (2.8% of the body weight) and then exposed to hyperbaric oxygen (2 atm) in a pressure chamber for 40 minutes. The intensity of tissue respiration decreased sharply one hour after bleeding (agonal stage). However, hyperbaric oxygenation not only prevented the depression of tissue respiration in the agonal stage but restored the normal level of oxygen consumption. The quantity of free sulfhydryl groups in the myocardium changed only in the agonal stage when they increased substantially. But hyperbaric oxygenation prevented them from increasing, keeping them within normal limits. The content of free radicals in the myocardium of the experimental animals decreased, especially in the agonal stage. But hyperbaric oxygenation restored them to the level found in intact animals. More than

1/2

USSR

LEONOV, A. N. et al, Kardiologiya, No 5, 1971, pp 140-142

two-thirds of the treated animals survived and were indistinguishable from the controls with respect to motor activity. All the untreated animals died within one hour of the start of bleeding.

"Some Peculiarities of Nitrogen Metabolism in the Central Nervous System
After Acute Anemization and Hyperbaric Oxygen Therapy"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, No 2,
1971, pp 42-28

Abstract: Hyperbaric oxygenation (2 atm for 40 min) of anemized rats (amount of blood let = 2.8% of the animal's body weight) normalized the level of alanine, threonine, and other free amino acids in the cerebral hemispheres and brainstem that had been altered by anemization. It also prevented the buildup of ammonia in the anemized brain seen in untreated animals in the agonal stage. More than two-thirds of the animals that received hyperbaric oxygen survived with motor activity and coordination of movements unimpaired, whereas all the untreated animals died within one hour of exsanguination. Thus, oxygen under high pressure had a corrective effect on the metabolic mechanisms of neurodynamics in the central nervous system despite the acute deficiency of blood.

**CHANGES OF TISSUE RESPIRATION, THE CONTENT OF SULFHYDRYL GROUPS
AND FREE RADICALS IN THE BRAIN OF ANIMALS IN ANEMIZATION AND HY-
PERBARIC OXYGENATION**

A. N. Leonov. A. A. Barsukov

The authors studied peculiarities of cellular respiration and of the content of SH-groups and free radicals in the great hemispheres of 350 nananesthetized rats following acute massive blood letting (2.8% of body weight) and after hyperbaric oxygenation (2 atmospheres for 40 minutes). Adaptation mechanisms particularly providing a high level of cellular respiration in the CNS and redox systems (realized through reactive links — SH-groups and free radicals) lie at the basis of the therapeutic effect produced by hyperbaric oxygenation in posthemorrhagic anemia.

"Changes in Tissue Respiration and Content of Sulfhydryl Groups and Free Radicals in the Brains of Animals After Exsanguination and Hyperbaric Oxygenation"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, No 1, 1970, pp 40-43

Abstract: Exsanguination of rats (2.8% of body weight) intensified tissue respiration, increased the number of sulfhydryl groups, and decreased the content of free radicals in the animal's brains. Hyperbaric oxygenation (2 atm for 40 min) enabled about 70% of the exsanguinated rats to survive, whereas all the untreated animals died within an hour. The therapeutic effect of hyperbaric oxygenation is attributed to its ability to ensure a high level of tissue respiration in the central nervous system, reduce the number of sulfhydryl groups, and slightly increase the content of free radicals. These characteristics of CNS metabolism are a manifestation of intracellular compensation mechanisms.

"Comparative Experimental Estimate of Various Visual X-Ray Introsopic Systems Using Electronic Devices"

Sverdlovsk, Defektoskopiya, No. 4, 1970, pp 137-139

Abstract: The authors of this brief communication, members of the Scientific Research Institute of Introscopy, discuss the laboratory model of the RIUS UM-92 Introscope, and offer indices by which this instrument can be compared with the RTI, an x-ray television introscope with a monocrystalline screen, described in an earlier article by the first-named author in collaboration with K. M. Dzhgalyan (Lavodskaya laboratoriya, 1962, No. 5). The RIUS UM-92 described in the present article is also an x-ray introscope with a monocrystalline screen, and uses an electron-optical light amplifier of the UM-92 type. A simple diagram of the instrument given in this article shows that the radiation from an x-ray source is projected through the specimen under examination onto the monocrystalline screen, the x-rayed image being converted to a light image by the screen and then put through the light amplifier and a telescope to the observer's eye. A third instrument containing

"Effective Pumping of a Continuous Garnet Laser by a Water Cooled Metal Halide Lamp"

Moscow, Kvantovaya Elektronika, Sbornik Statey, No 2(8), 1972, pp 112-115

Abstract: A design is proposed for a water-cooled metal halide flash tube. The spectral characteristics of lamps filled with Xe + Hg + NaI + RbI and with Xe + Hg + NaI + TlI are studied. Nd:YAG laser emission power is measured as a function of pumping for lamps with different fillers. It is shown that the differential efficiency of a laser when pumped by a tube with sodium and rubidium iodides added is 3.5 times as high as when a xenon tube is used, and 1.5 times as high as when a krypton tube is used for pumping. Four illustrations, bibliography of seven titles.

EQUIPMENT CREWS TROUB SHOOT AND PREVENT

Methods of Elimination of the Aircraft's Technical Problems

In No 6 of this journal for 1971, an article by Engineer-Major A. G. Leonov entitled "Teaching Operators to Seek Out and Eliminate Trouble" was published. In it a number of questions were raised concerning the organization of and methods for teaching operators the most efficient procedures in seeking the causes of trouble and eliminating them.

The editors have received a large number of letters and responses to this article. They all show that our author touched on pressing problems which concern not only officers but are engaged in the daily work of training and educating operators. As we know, skilled operators in radar station teams are the direct base to technicians, and in case of necessity are called on to replace them, ensure correct maintenance of the apparatus and equipment, therefore, developing the operators' practical skills in detecting and eliminating trouble is one of the very important problems.

The ability to define the nature of trouble, promptly discover the causes of it, and reliably eliminate them is achieved during the process of operating the particular equipment. Those who have an outstanding knowledge of the equipment and analyze its operation and behavior in a thorough, profound manner attain the necessary habit. Therefore, it is completely correct of Officer Ya. S. Sidorov to note that in teaching operators to seek out and eliminate trouble, it is essential to begin from the actual forms of service of our holders and the amount of that time which is allocated by the course of combat training or the curriculum to theoretical

"Development of the Concept of Slip in the Theory of Plasticity"

Frunze, Izvestiya Akademii Nauk Kirgizskoy SSR, No 2, 1972, pp 4-11

Abstract: The plastic deformation of a body, the volume of which does not change in the process of this deformation, is determined via the intensity of movements (local slips) of the linear distortions taking place along a set (fam) of planes and directions of slip. A study is made of "semisimple" loading, when the sign of the stresses changes only once. The deformation of plastic materials which have a yield platform is described for the first time on the basis of the slip concept. 3 figures. 12 references.

"Elements of the Analytical Theory of Plasticity"

Moscow, Doklady Akademii Nauk SSSR, Vol 205, No 2, 1971, pp 303-306

Abstract: Polycrystalline materials whose elastic deformations are determined by Hooke's law are considered. By subtracting these from the observed deformations, the author obtained the nonelastic deformations; deviations from the latter are known as plastic deformations. Experiments with monocrystals have shown that local sliding occurs in planes with highest atomic density in the direction of maximum density under certain conditions. Adopting the axiom that elementary sliding in an ideally uniform model of a polycrystalline body varies its mechanical characteristics in virtually all directions, the author sets up a mathematical model of the plastic body and mathematically describes the initial stages of plastic deformation. In this description, only those materials in which normal stresses have no effect on plastic deformation are considered, and the effects of time and the consequences of slippage on the resistance to shear are neglected. The author is associated with the Institute of Physics and Mathematics at Frunze.

"Basic Postulates of the Theory of Plasticity"

Moscow, Doklady AN SSSR, Vol 199, No 1, 1971, pp 51-54

Abstract: The author discusses small macrohomogeneous deformation of a polycrystalline solid. Because of the elastic anisotropy of the crystal grains, internal forces are characterized by a certain nonhomogeneity which is accounted for by a change in the shear strength as a function of the tensor of elastic macrodeformations (stresses). The analysis applies only to materials in which the change in shear strength is independent of the sequence of slips for small plastic deformations (postulate of anti-isotropy). The problem of determining the components of plastic deformation is reduced to solution of an integral equation. The author thanks K. N. Rusinko for all-round assistance with the work. One figure, bibliography of five titles.

"Elements of the Theory of Elasticity"

Moscow, Doklady Akademii Nauk SSSR, Vol 199, No 2, 11 Jul, 71, pp 293-295

Abstract: The author examines a solid state uniform model having continuously distributed mobile defects of dislocation type. He assumes the components of the deformation tensor to be small and their variation rates to be such that the time influence can be ignored. He determines the plastic deformation by the intensity of the dislocation shifts (local glide) which take place along a number of planes and directions in the glide planes. He first discusses the condition of weakening as a result of elastic deformations and cites the axiom: For a proportional load beyond the elastic limit the bundle of glides includes planes and directions of maximal tangential stress. His second axiom: With a growth of any components of the tangential stresses the increase in resistance to displacement as a result of elastic deformation will always be negative. He gives mathematical proof of his position and then proceeds to briefly discuss the stages of small plastic deformation. The article contains a bibliography of 1 title.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A SPACE METEOROLOGICAL STATION IN A CIRCUMTERRESTRIAL ORBIT CAN DAY AND NIGHT TRANSMIT WEATHER DATA MAKING IT POSSIBLE TO WARN THE COUNTRY OF IMPENDING DANGEROUS METEOROLOGICAL PHENOMENA. THE INFORMATION IS TRANSMITTED IN THE FORM OF PHOTOGRAPHS. THESE PHOTOGRAPHS CLEARLY PINPOINT THE LOCATION OF STORMS AND THEIR DIRECTION. THE HYDROMETEOROLOGICAL CENTER USSR IS EVEN NOW RECEIVING SUCH INFORMATION FROM A WHOLE SERIES OF METEOR SATELLITES. CREATED ON THE BASIS OF THE LATEST ADVANCES IN SOVIET SCIENCE, IT IS OF THE GREATEST SERVICE IN COMPILING BOTH LONG AND SHORT RANGE FORECASTS. HOWEVER, ALL THIS REQUIRES WELL TRAINED GROUND PERSONNEL SINCE POOR INTERPRETATION OF THE PHOTOGRAPHS WOULD CANCEL OUT THIS NEW SOPHISTICATED SOURCE OF INFORMATION. A SPECIAL SECTION AT THE HYDROMETEOROLOGICAL CENTER HANDLES SUCH WORK: IT HAS THE RATHER ROMANTIC NAME OF SATELLITE VERTICAL. THE SECTION IS MANNED BY DEDICATED PIONEERS IN THIS NEW BRANCH OF METEOROLOGY. ALL SATELLITE DATA MUST BE CORRELATED WITH GROUND DATA FOR COMPILING MAPS OF CLOUD COVER DISTRIBUTION. THE COMPLEX TASK OF INTERPRETING PHOTOGRAPHS CANNOT YET BE AUTOMATED. HOWEVER, PROCESSING OF DATA ON RADIATION FLUXES IS COMPLETELY AUTOMATED. A SPECIAL PROGRAM DEVELOPED AT THE CENTER ENSURES THAT COMPUTERS CAN HANDLE THE VAST AMOUNT OF DATA ON RADIATION IN A VERY SHORT TIME. THE VOLUME OF RADIATION DATA RECEIVED FROM SATELLITES EXCEEDS THAT WHICH IS RECEIVED FROM GROUND STATIONS THROUGHOUT THE COUNTRY. SATELLITE DATA ARE SORTED BY COMPUTER BY TYPES: SOLAR RADIATION, LIGHT REFLECTED BY THE EARTH, RADIATION OF THE EARTH ITSELF, ENERGY OF ELECTROMAGNETIC WAVES.

"Internal Structure of Operating Programs of the BASIC-6 System"

V sb. Teoriya yazykov i metody postroyeniya sistem programmir. (Language Theory and Methods of Constructing Programming Systems--collection of works), Kiev-Alushta, 1972, pp 244-256 (from RZh-Kibernetika, No 12, Dec 72, Abstract No 12V467)

Translation: The internal structure of the operating programs in the BASIC-6 system is described. The compilation of the program from the BASIC-6 language will be carried out by a step-by-step transmitter, that is, the operating program is created during the construction process. On destroying any operator, a "gap" is formed in it requiring extension of the section of the operating program located below the "gap" in memory. In order to simplify the work with respect to memory allocation for all elements pertaining to the program, a quantized structure is proposed in the BASIC-6 system which is a special form of list organization of information. A study was made of two quantization procedures: constant quanta and variable-length quanta. It is noted that it is possible to execute such languages as IOSS and APL on the basis of the structure of the BASIC-6 system.

LEONOV, R., Special correspondent, Pushchino, Moscow Oblast
"Working Bacteria"

Moscow, Leninskoye Znamya, 13 Aug 70, p 3

Abstract: At the Institute of Biochemistry and Physiology of Microorganisms, USSR Academy of Sciences, I was shown a unique instrument, the ANKUM, an automated apparatus for continuous cultivation of microorganisms. The chaotic intertwining of rubber tubes, the ornate glass tubes and the flickering of different colored lamps on the panel only appear to be chaotic at first glance. Some magic was being wrought at this time in the apparatus, which occupies almost the entire width of the room: the minutest organisms were being born, were growing and multiplying under human control. This was the continuous process of cultivation of microbes, and not just any bacteria, but those that the scientists of the Moscow suburb needed to study. The bacterial "incubator" was constructed in accordance with the newest technology. Bacteria are continuously supplied with fresh nutrient medium, and the rate of its influx and chemical composition can be altered at will. Fresh "sterilized" air is delivered continuously to provide for normal respiration of bacterial cells. Extremely complex instruments monitor the condition of these unusual patients, their temperature, acidity, cell concentration and oxygen dissolved in the suspension.

1/4

USSR

LEONOV, R., Leninskoye Znamya, 13 Aug 70, p 3

The readings from all pickups are fed to a centralized control system. When needed, the system itself automatically sends questions to the pickups, and, having made a decision, develops the appropriate signals to control the unit. One of the "masters" of ANKUM, is Viktor Sterkin, Candidate of Engineering Sciences, on the staff of the Laboratory of Growth and Development of Micro-organisms. "The principle of our method," he states, "is exceptionally simple. In the cultivator where the cells grow, fresh nutrient medium is delivered at a specific rate, and simultaneously the same quantity of fluid with "mature" bacteria is removed. By creating specific and strict cultivation conditions, we can maintain our bacteria in the same physiological state for a long time. This enables us to obtain quantitative relationships between their growth, production of specific products, and cultivating conditions. Having learned these relationships, we can then control processes of bacterial biosynthesis. Obviously, our objective is to standardize cultivation conditions, which is necessary for stable continuous biosynthesis with maximum productivity. And then to develop cells with specific properties, with a specific chemical composition..." To demonstrate the operation of ANKUM, Viktor artificially slowed cell growth. The "alarm" signal was immediately flashed by the biomass concentration pickup. Immediately the centralized control system fed the command: "Reduce delivery of nutrient medium immediately!" Equilibrium was maintained and the bacteria continued to develop normally.

2/4

- 30 -

USSR

LEONOV, R., Leninskoye Znamya, 13 Aug 70, p 3

"Viktor, what do you do with 'wild' bacteria, 'registering' on the internal surfaces of the apparatus?" "Obviously it is practically impossible to sterilize ANKUM in an autoclave. In our automation, sterilization is automatic, and, of course, there are no 'undesirable' bacteria in it." "Tell us a little about the latest research done on ANKUM!" "Our main objective is to investigate the kinetics of growth of bacterial cultures under different conditions of continuous cultivation. Our high speed system of continuous control and recording enables us to study the dynamics of behavior of bacteria in a state of stable growth, as well as during periods of rather complex transitional processes induced by different factors. Analysis of bacterial behavior when moving from one state of 'balanced' growth to another yields an exceptional amount of information for construction of kinetic models of microorganism growth. A particularly important direction of research on ANKUM could be development of methods of obtaining continuous cultures of synchronously dividing cells. Considerable bioengineering information has already been accumulated, and it has enabled us to develop the blueprints for an improved unit, ANKUM-2. The new equipment will have great analytical capabilities." Dozens of professions are already involved with bacteria. They are used to obtain amino acids, certain vitamins, enzymes for light and food industries, antibiotics, protein preparations for animal husbandry. Synthetic foods are not a fantasy. There are already plants manufacturing artificial food, although they are not as yet working for the animal-breeding

LEONOV, R., Leninskoye Znamya, 13 Aug 70, p 3

industry. The time is not distant when age-old problems of mankind will be easy to solve. Our descendants will not have to rely on natural resources, and they will begin to control life. Invisible workers, bacteria, will create fresh artificial nutrients, drugs and different substances at enormous plants, under human control. The multibillion army of microbes is an unused resource of our planet.

THE CORRELATION BETWEEN HIGH AND LOW POPULATION GROWTH RATES IN ECONOMICALLY DEVELOPING COUNTRIES

DATE: 02.01.77

Article by S. A. Leonov, All-Union Scientific Research Institute of Social Hygiene and Public Health, Organization Head S. G. Gerasimov, Moscow, USSR, Demographic Statistics, No. 1, 1977, pp. 1-11.

8.5. Yastrenkiy conducted an investigation in the 1970s and defined the boundary between high and low reproduction economically developed countries. In the years that have passed since this study, this boundary changed in view of the average demographic situation in each country, there have been significant declines in birth, fertility, and death rates. The correlations between the chief indices of reproduction in population have also changed. The birth rate indices for the USSR in 1961-1970, the USA in 1961-1970, England and France in 1960, and Japan in 1960 became lower than the boundary established by S. A. Yastrenkiy. Everywhere, reproduction of population remained high in more economically developed countries, since it was not only the indices of overall and age-related fertility but also death rate indices that underwent significant changes.

Our objective was to establish the present boundary between high and low population reproduction rate in economically developed countries of the world corresponding to the present birth and death rate levels. For this purpose we analyzed health and demographic data from 14 economically developed countries and made the necessary calculations for all these countries separately for European socialist nations (USSR, GDR, Poland, Hungary, Rumania, Czechoslovakia, and Yugoslavia), except the USSR, then for the USA and economically developed capitalist nations (USA, Canada, Japan, England, France, FRC, Finland, Denmark, Netherlands, and Sweden).

S. A. Yastrenkiy, "The Correlation Between Indices of Reproduction of Population in the book by A. Ye. Koskiy: Kurs Demograficheskoy Statistiki (A Course on Demographic Statistics), Moscow, 1945.

"Measurement of Fluid Flow by the Voluminal Statistical Quantization Method"

V sb. Optimiz. Issled. Operatsiy, bionika (Optimization and Operations Research. Bionics--collection of works), Moscow, Nauka, 1973, pp 173 - 178 (from RZh Avtomatika Telemekhanika i Vychislitel'naya Tekhnika, No 11, Nov 73, abstract 11 A354)

Translation: A vessel contains some quantity of fluid in which particles of a solid, luminescent substance are distributed in a statistically uniform manner. As the particles pass through a pipeline, together with the fluid, ultraviolet radiation is stimulated. The frequency of tracking of the luminescence is proportional to the instantaneous flow of the emerging fluid.

Some theoretical questions concerning the automatic monitoring of flow from the parameter of a discrete random process are considered. The installation is described and the results of experimental studies are reported. Calculated relationships are given for evaluating the accuracy of measurement. Three illustrations, three bibliographic citations.

Abstract by the author.

"Deformation and Stresses in Mounts of Roll Stands of Four-High
Rolling Mills"

Moscow, Vestnik Mashinostroyeniya, No 9, Sep 73, pp 16-21

Abstract: The strength conditions in the mount of a roll stand
of the four-high rolling mill 5000 of the All-Union Scientific
Research, Planning, and Design Institute of Metallurgical Machi-
nery were calculated. The deformations and stresses were deter-
mined, using Castigliano's theorem, for a simplified form of the
mount according to a presented schema. The applied calculation
method of the inflexibility and strength of closed type mounts
considers the clearance between the mount stands and the bea-
rings of supporting rolls and the variable stiffness of cross
ties. On a level with the calculations, including the fatigue
strength, the stressed condition of the mount was also investi-
gated by the polarization-optical method on a simplified model

" γ -Ray Spectrum From (n, γ)-Reactions in Sm^{150} and Sm^{151} Samples"

Moscow, Yadernaya Fizika, Vol. 13, No. 4, Apr 71, pp 681-687

Abstract: The γ -spectra for the radiation capture of thermal neutrons by Sm^{150} nuclei and Sm^{151} radioactive nuclei were measured with a single-crystal $\text{Ge}(Li)$ gamma-spectrometer. It is noted that in elements with even Z in the range of atomic weights from 90 to 200, isotopes with odd A as a rule have the greatest thermal neutron capture cross section. The cross section of some of these isotopes is so great that a purity of the sample greater than 99.99% is necessary to eliminate the considerable contribution from these. Since there is great difficulty in obtaining samples of such high purity in electromagnetic methods of isotope separation, this study used the method of burning out admixture isotopes having an anomalously high capture cross section for thermal neutrons to obtain isotopes of the required purity. The necessary Sm^{149} purity was obtained by burning out

1/2

USSR

GROSHEV, L. V., et al, Yadernaya fizika, Vol. 13, No. 4, Apr 71, pp 681-687

Sm^{149} in an integral neutron flux, $2.2 \cdot 10^{20}$ neutron/cm². The following neutron binding energies were obtained: 5596 ± 1 keV in Sm^{151} and 8158 ± 1 keV in Sm^{152} , the two isotopes which make the greatest contribution to the gamma-spectrum. Diagrams of the gamma-transitions for Sm^{151} and Sm^{152} are given. It is noted that gamma-quanta release of Sm^{151} nuclei is of interest, since the nucleus is on the boundary of the transition region from spherical to elongated nuclei. It is then possible to compare the gamma-spectra of Sm^{151} and Sm^{152} , which have a number of neutrons equal to 89 and 91 respectively. This problem will be considered in detail by the authors after measurements of the gamma spectrum of Sm^{155} .

"A Cold Trap"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztzy, Tovarnyye Znaki,
No 10, Apr 72, Author's Certificate No 332253, Division F, filed 9 Jan 69,
published 14 Mar 72, pp 136-137

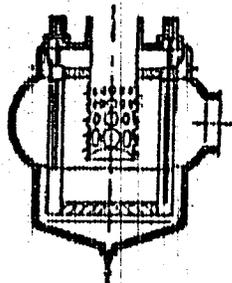

Translation: This Author's Certificate introduces a cold trap for vacuum pumps. The device contains a thermally insulated housing with fittings for connecting it to the exhausting vacuum pump and to the space being evacuated. Located in the housing are optically opaque cryogenic panels cooled by a liquid coolant such as nitrogen. As a distinguishing feature of the patent, the effectiveness of the trap is improved by making the cooled panels in the form of a vertical annular louvred screen with cooling tubes on the faces and collectors for the upper and lower shields located in the cavities of the louvred screen. The screen and shields taken together form a closed nonhermetic chamber which accommodates a dis-

1/2

"Method of Coverings in Searching for Global Maximum of Functions of Many Variables"

V sb. Issled. po Kibernetike (Studies on Cybernetics -- Collection of Works), Moscow, "Sov. Radio," 1970, pp 41-52 (from *NZh-Matematika*, No 9, Sep 70, Abstract No 9B569, by I. Shelikhova)

Translation: An iterative method of coverings is presented. This method enables one to find the global maximum of functions of many variables with any a priori given precision and for the case in which there are several local extrema. The general scheme of the method is described for the following problem A: in a closed, simply-connected region X of E_n , the continuously differentiable function $f(x)$ is given; from a given $\epsilon > 0$ it is required to find a point such that $x(\epsilon) \in X \subseteq \mathbb{R}^n$, for which the inequality $f(x(\epsilon)) \geq \hat{f}(X) - \epsilon$, where $\hat{f}(X) = \sup_{x \in X} f(x)$. Convergence of the method of coverings is demonstrated and a computational algorithm is formulated for finding a global maximum based on this method. The method of coverings is compared with the S. A. Chaplygin method of solving the Cauchy problem for differential equations. Bibliography: eight entries.

"Gunn Effect Devices with a Variable Energy Gap"

Leningrad, Fizika i Tekhnika Poluprovodnikov, Vol 4, No 8, Aug 70, pp 1609-
1611

Abstract: The authors discuss the possibility of developing devices based on the Gunn effect with an energy gap which varies lengthwise of the specimen. Such devices would be more suitable and convenient for use in integrated circuits than would analogous devices which utilize a variable cross sectional area or variable gradient of equilibrium carrier concentration. The energy gap can be varied either by changing the chemical composition lengthwise from the cathode to the anode according to a predetermined law, or by creating variable pressure along the specimen by gluing it to a substrate with a greater coefficient of thermal expansion while heat is applied and then cooling the assembly. The use of Gunn effect devices with variable energy gap would enable a considerable increase in the efficiency of Gunn generators. In the flip-flop mode, Gunn effect diodes with a variable energy gap could be used to produce pulses whose duration is determined by the bias voltage, and such devices could also be used to measure the duration of input pulses.

ABSTRACT. 45 PATIENTS WITH MYOCARDIAL INFARCTION HAVE BEEN INVESTIGATED. THE NEUROLOGIC SYMPTOMATICS HAS NOT BEEN FOUND IN 29 OF THEM, IN 9 PATIENTS IT HAS BEEN VAGUELY EXPRESSED, 9 HAVE HAD SEVERE DISTURBANCES OF THE CEREBRAL BLOOD CIRCULATION. MORE FREQUENTLY SUCH COMPLICATIONS HAVE OCCURRED IN OLDER AGE GROUPS AND IN CASES OF TRANSMURAL MYOCARDIAL INFARCTIONS AND APPARENTLY THEY HAVE BEEN CAUSED BY MORE MARKED ALTERATIONS OF THE BRAIN VESSELS, BY DISTURBANCES IN THE COAGULATION AND ANTICOAGULATION BLOOD SYSTEM AND ALSO BY ADDING THE PATHOLOGICAL REFLEX MECHANISMS.

"The Red Cheeked Suslik and Its Significance in the Epizootiology of Omsk
Hemorrhagic Fever"

Novosibirsk, Izvestiya Sibirskogo Otdeleniya Akademii Nauk, SSSR, Seriya Biolog-
icheskikh Nauk, Vol 10, No 2, Aug 70, pp 126-129

Abstract: A study was made of the habitat and distribution of the red-cheeked
suslik in Western Siberia and its role in the epizootiology of Omsk (epidemic)
hemorrhagic fever. Studies begun in 1966 established a high population density
of these rodents in Karasukkiy Rayon of Novosibirskaya Oblast, where the
oblast borders on Kazakhstan and Altay Kray, an area long known as a natural
focus of epidemic hemorrhagic fever. The suslik usually nests in virgin steppe
lands, near watersheds, and on the periphery of birch-aspen groves. Serologi-
cal studies of susliks captured in this area showed the presence of antibodies
to the virus of Omsk hemorrhagic fever, which indicates the circulation of the
virus in the rodent population. The communicable character of the disease is

established. Ectoparasites (mainly Gamasidae) which live on susliks and infest suslik nests in mass numbers were gathered on the assumption that some species of these parasites may serve as carriers of the virus of Omsk hemorrhagic fever. The investigations have as yet failed to establish a definite connection between the epizootiology of the disease and the presence of the suslik and its ectoparasites. Nevertheless, the large concentration of red-cheeked suslik in the area, the considerable immunity of these rodents to the virus of Omsk hemorrhagic fever, and the abundance of ectoparasites which may be assumed to be virus carriers indicate that the suslik may play an important role in the epizootiology of this disease.

Abstract No 10A515)

Translation: The proposed research method is based on the visuali-
zation of the field distribution in open structures (resonators,
for example) by introducing into their space a test body which,
entering a region of greater or lesser intensity in its motion
along a specified trajectory, varies to some extent the parameters
of the structures. The trajectory of the test body is traced by a
beam on the screen of a cathode-ray tube. The brightness of the
beam is proportional to the signal taken from the open structure.

METHOD OF LEAST SQUARES IN PROBLEMS OF IDENTIFICATION OF DYNAMIC SYSTEMS

Article by Yu. P. Leonov, Institute of Problem Control; Moscow, U.S.S.R. *Math. Eng. Comput.*, Vol. 18, No. 1, 1971, abstracted September 1970, pp 64-67.

The solutions of a special class of integral Fredholm equations of the first kind are examined in this article. These equations are obtained in the solution of the problem of identification [1] of a dynamic system by the method of least squares.

Two cases are examined:

a) some point of aberration in the system is accessible to observation;

b) only the steady motion of a system is accessible to observation.

If some point of aberration of a system is accessible to observation, then evaluation of its weight function is more accurate in relation to the evaluation obtained during observation of its steady motion.

It is shown that in both cases there is a solution of the problem in factor-space with an energetic norm [2]. The solution may be sought in all solutions, however, are equivalent from the point of view of the minimum mean square error. The appropriate solution of the problem is determined in energetic factor-space, and this is the alternate solution of the problem of identification as an incorrect problem [3].

a) Some aberration of the system by input signal $u(t)$ is accessible to observation. A linear system with constant parameters is described by matrix weight function $w(t)$. The system is excited by signal $x(t)$ in the interval $(0, T)$. At the output of the system is signal $y(t)$, which is a distorted version of the true output signal $Y(t)$. In the given case the aberration of the system occurs at the moment of application of the signal $x(t)$ for $t = 0$. It is assumed that the system has a finite memory, and consequently signal $X(t)$ is represented in the form

"Experience in Using the Results of Physiological Examinations to Predict the Occupational Fitness of Adolescents as Metal Turners"

Moscow, Gigiyena i Sanitariya, No 4, 1973, pp 27-29

Abstract: The authors found 28 key physiological functions to be involved in the various operations performed by metal turners, e.g., muscular strength, precision of kinesthesia, speed of reaction to white and red light, etc., and tested them in 100 15- and 16-year-old youngsters attending a vocational school before they acquired any specific skills and abilities. The results of the tests were compared with evaluations of the skills of the same persons made at the end of the training period by master workers. The test results coincided with the evaluations in about 90% of the cases. The authors caution that the physiological tests are not completely predictive of ultimate success, which also involves such factors as interest in the work, sense of discipline, social considerations, personality, etc.

"Some Problems of Statistical Testing of Radio Devices"

Metody razrab. radioelektron. apparatury. No 1 (Methods of Developing Radio-electronic Equipment. No 1), Moscow, 1970, pp 174-178 (from RZh-Radiotekhnika, No 8, Aug 70, Abstract No 8A186)

Translation: This article contains a theoretical analysis of errors in determining the numerical distribution characteristics of the output parameters by the Monte Carlo method with limited statistical data. It is demonstrated that when estimating the a priori probability of fail-free operation of a radio equipment and also during statistical testing of large systems it is possible to take the logarithmically normal distribution as the distribution law. The block diagram of the program of statistical tests of radio devices permitting investigation of the output parameter distribution laws is presented. There is one illustration and a two-entry bibliography.

ABSTRACT. THE AUTHORS CONVENED A CLINICO LABORATORIAL ANALYSIS OF 44 CASE HISTORIES OF PATIENTS WITH PROGRESSIVE LEUKOENCEPHALITIS AND NEUROECTODERMAL BRAIN TUMORS. SPECIAL ATTENTION IS BEING GIVEN TO PSEUDOTUMOROUS SYMPTOMS IN DIFFERENT FORMS OF PROGRESSIVE LEUKOENCEPHALITIS (SCHILDERS, SCHOLZ, VAN BOGART'S DISEASE). FOR DIFFERENTIAL PURPOSES THE AUTHORS UTILIZED CTONEUROLOGICAL AND X RAY CONTRAST METHODS, AS WELL AS EEG DATA. THE EEG OF PATIENTS WITH PROGRESSIVE LEUKOENCEPHALITIS DISPLAYED AN OPEN INTRAHYDROCEPHALIA WITHOUT A DISPLACEMENT OF THE VENTRICULAR SYSTEM. THE EEG CHANGES WERE IN THE FORM OF A DIFFUSE DISORGANIZATION OF THE RHYTHMS WITH A LOW AMPLITUDE ACTIVITY OR HIGH VOLTAGE PAROXYSMS OF ACUTE AND SLOW WAVES. THE CTONEUROLOGICAL CLINICAL PICTURE IN PROGRESSIVE LEUKOENCEPHALITIS IN COMPARISON TO TUMORS WAS CHARACTERIZED BY MULTIPLE FOCI, SUB AND SUPRATENTORIAL SYMPTOMATOLOGY. THIS INDICATES NOT ONLY TO A LESION OF THE HEMISPHERES, BUT OF THE STEM STRUCTURES AS WELL. "Interactions in the Titanium Nitride-Magnesium Oxide System"

Moscow, Izvestiya Akademii Nauk SSSR, Neorganicheskiye Materialy, Vol 8,
No 5, 1972, pp 846-848

Abstract: The solid-phase interaction in the system TiN-MgO is studied. The end product of this interaction is $\alpha\text{-Ti}_2\text{O}_3$; the interaction occurs with the formation of an intermediate product, a TiO-MgO solid solution, which decomposes into $\alpha\text{-Ti}_2\text{O}_3$. The coefficients of diffusion of titanium through the phases $\alpha\text{-Ti}_2\text{O}_3$ and MgO are determined.

"Self-Quenching Of Free Oscillation In A Ruby Laser At Low Temperature"

Kvantovaya elektronika (Quantum Electronics), Moscow, No 6(12), 1978, pp. 92-93

Abstract: Duration of generation and the energy output of free oscillations in a ruby laser at low temperature are investigated. The experiments were conducted with two standard specimens of ruby with a rough-transparent lateral surface with plane-parallel ends without reflective coatings. The specimens were 120 mm long and 12 mm in diameter. Pumping was accomplished in a two-cylinder narrow illuminator by two pulse xenon IFF-2000 lamps with power supply from a bank of capacitors with a capacitance of 1200 μF . The pumping energy changed in the limits from 0.9 (threshold) to 6.5 kilojoule. The ruby was located in a glass tube through which gaseous nitrogen was blown which had previously passed through a coil immersed in liquid nitrogen. The temperature of the crystal reached minus 180° C. It is determined that duration of generation is decreased with an increase of the pumping energy. In the process, saturation of the output radiation energy also takes place. It is shown that the duration of generation in a resonator with a low figure of merit is determined by the time of $1/2$

USSR

LEONTOVICH, A. M., et al., *Kvantovaya elektronika*, No 6(12), pp 69-73

equalization of the transverse distribution of inverse populations in the process of generation, which leads to an additional decrease of the figure of merit. Formulas are obtained which determine the duration of generation and the output radiation energy. The authors thank Prof. M.D. Galanin for discussion of the work and V.N. Smorchkov for assistance in the work. 3 ill. 9 ref. Received by editors, 3 Dec 1971.

TOO FEW CADRES, POOR PLANNING STUNT PSYCHOLOGY

Moscow PRAVDA 25 Feb 70 p 3 L

(Article by A. Leontyev, member of the USSR Academy of Pedagogic Sciences and professor of Moscow University: "Penetrating All Spheres of Life")

Here is a very simple illustration. Over the past 30 years, the number of instruments in an airplane has increased 10-fold and the time for carrying out each operation to control the plane has been reduced 6-7 times. It is understandable that under these conditions any fault in the design of signal or control instruments impairs the perception and attention to them and and the speed for making decisions with possible grave consequences. In control of large and super-large systems (a unified energy system, a unified communications system, a unified system of air traffic and so forth) the cost of every mistake committed by a man because of disorientation between technical decisions and the peculiarities of the human psychology is generally expressed in astronomical figures. The gains--in the case of a correct decision-- are also astronomical.

19700910

30

AN0032608

Now one has no need in general to prove to anyone the importance of psychological science. Scientific organization of labor is now impossible without recommendations from specialists in the psychology of labor. The quest for optimum methods to fulfill labor operations, revealing factors which increase working capability, study of the mobilization and stimulation of labor, the adaptability of people occupied in labor, questions of professional selection and professional orientation, establishing psychological reasons for traumatism--this is far from a full list of the themes that are part of the scope of psychological science. It is unnecessary to prove how important it is to solve these problems today under conditions of the economic reform.

Intensive development of research in the border areas which connect psychology with the biological sciences, technology, and mathematics has equipped it with accurate objective methods and has enriched it with a cybernetic and mathematical approach to the study of psychological processes. The work of a number of our psychologists has been awarded Lenin, state and Lomonosov prizes.

In many departments, laboratories and groups are being created which work out applied problems of psychology. Work in this field has noticeably intensified in nonpsychological type scientific research institutions too; in philosophical, medical, and engineering scientific research institutions and also in social science institutions--of philosophy, law, concrete sociological research and pedagogics.

74
19700911

AN9032608

Until comparatively recently psychology referred to pedagogical sciences and was departmentally subordinate to the Ministry of Education. This was a serious obstacle to its comprehensive development and gave rise to curiosities such as, for example, awarding the degree doctor of pedagogical sciences for research into... the behavior of bees!

However, as PRAVDA has already noted, development of these faculties and departments is not sufficiently provided for. They are experiencing an acute shortage of premises, scientific and pedagogic cadres, and equipment. Therefore their "production capacity" is extremely small. Even the psychology faculty at Moscow University, the biggest in the country, which has at its disposal first-class professorial and teaching personnel, still does not have the strength to accept into its day department more than 50-60 students. Accordingly the output of specialist psychologists with university education continues to remain at the level of approximately 180 persons per year throughout the country. Of course, this will be no means suffice.

A serious shortcoming is that demands for psychologists of different types are not studied by anyone--either departments, or the Gosplan. In fact they remain relatively hidden.

I shall cite a simple example. It is perfectly obvious that industrial enterprises, control staffs engaged in scientific labor organization must have at least one specialist on the psychology of labor. If one conditionally accepts that at least 1,000 major enterprises have a particular need for psychologists, this means that with the present output of specialists we shall be able to guarantee them only... after the year 2000.

19700912

AN0032608

I have already spoken of the unevenness of the development of certain branches and directions of psychological science. Even more serious is the comparative slackening of attention toward general theoretical and methodological questions. At the moment, when an accelerated development is taking place in research of an applied nature and research in border areas, into which are drawn a considerable number of workers who possess no serious scientific and psychological training, it is particularly important to maintain the superiority of our psychology, which is developed on the basis of scientific Marxist-Leninist methodology. Indeed it owes its successes to this, and we are legitimately proud.

Until comparatively recently psychology referred to pedagogical sciences and was departmentally subordinate to the Ministry of Education. This was a serious obstacle to its comprehensive development and gave rise to curiosities such as, for example, awarding the degree doctor of pedagogical sciences for research into... the behavior of bees!

Now the situation has been rectified. Obviously the time has come for a second step: psychology must occupy an equal position in our main scientific headquarters-- the USSR Academy of Sciences. One can no longer fail to notice that today psychology is a broad science which unites 10 specialized disciplines and is closely linked with solution of any current tasks of communist building.

The USSR Academy of Sciences must become the center of psychological sciences also. This will benefit both psychology and a number of social, natural, and technical sciences whose lengthy isolation from psychology has caused and continues to cause a great deal of harm.

Translation: An explanation is given of a block diagram for a random sequence generator. The complete schematic of the device is given and the interaction between subassemblies is explained. Feedback is introduced to improve accuracy. Algorithms are presented for checking the random sequence generator, and a comparative analysis of the algorithms is given. Authors' abstract.

"On the Problem of Physical Generation of Random Binary Sequences for Simulation of Errors in Communications Channels"

V sb. Peredacha diskretn. soobshch. po kanalam s gruppamiyuzhchensiva oshibkami (Transmission of Discrete Messages Over Channels With Grouped Errors-- collection of works), Moscow, "Nauka", 1972, pp 116-126 (from RZh-Kibernetika, No 6, Jun 72, Abstract No 6V500)

Translation: Methods of physical generation of random numbers are classified along with continuous realizations with a given distribution law. Principal attention is given to obtaining equally distributed random numbers. It is shown that registration of a periodically changing state at random times gives the least deviation from a given distribution law. Formulas are presented for calculating errors. A method of generating binary random sequences is recommended. Authors' abstract.

Abstract: This analog-type memory device using a selsyn pickup has the distinguishing feature of having the program carrier fixed to the selsyn shaft, with the perforator and counting element on the opposite side of the carrier disc. The effect of this arrangement is to simplify the device.

"Experimental Study of the Temperature Distribution in a Laminar Thermal Sublayer and in the Turbulent Core of a Boundary Layer in a Thermal Radiation Field"

V sb. Teplo- i massoperenos (Heat and Mass Transfer — Collection of Works), Vol. 1, Minsk, 1972, pp 355-362 (from RZh-Teploenergetika, No 7, Jul 72, Abstract No 11G155)

Translation: The effect of interaction of a gasdynamic field (both temperature and velocity) with the thermal radiation field was determined experimentally on the basis of finding in pure form the degree of deformation of the temperature field caused by this interaction. The experiments were conducted in a subsonic wind tunnel of the closed type. CO₂ was used as the absorbing gas. The measurement section consisted of a plane plate in a gas flow coming from a nozzle and forming a turbulent jet at the wall. The thermal radiation source was in the form of a SiC rod. Temperature in the boundary layer was measured with a resistance microthermometer with a tungsten gold-plated grid of diameter 20 μ . The experiments measured the velocity and temperature at

the edge of the nozzle (with a Prandtl tube and a screened thermocouple), the temperature of the plate and the thermal heat source (by thermocouples and optical pyrometer), the electrical load conducted to the plates, the temperature of the insulation under the plates and in the surrounding air (to calculate thermal losses). The measurements show that the linear dependence of the dimensionless temperature on the coordinates in the laminar sublayer that was obtained in air becomes considerably nonlinear in CO₂ in the presence of the radiation field. The maximum difference in the temperature profiles in the neighborhood of the walls in the CO₂ measurements and in air was 40-80. Consequently, the additive method in calculating thermal flows by convection and radiation to the wall (from the wall) without considering the interaction of the gasdynamic field and the thermal radiation field is unsuitable. These results are supported by an analysis of an approximation model corresponding to heat transfer considering radiation in a laminar thermal sublayer. 4 ill., 5 ref. E. G. Namsarayev.

"Determination of Relative Heat and Mass Transfer Coefficients and Critical
Parameters of Turbulent Boundary Layer Separation with Nonuniform Injection
under Nonisothermal Conditions"

Minsk, Inzhenerno-Fizicheskii Zhurnal, Vol 19, No 4, Oct 70, pp 737-741

Abstract: Simple approximating formulas are presented for calculating the
relative heat and mass transfer coefficients and critical parameters of bound-
ary layer separation in the presence of a nonuniform injection, chemical
reactions, dissociation etc. under strong nonisothermal conditions. A com-
parison of the results obtained on a computer with those obtained by formulas
shows a rather good agreement. These formulas can be extended to the case
when the Reynolds numbers are finite. 3 figures, 3 references.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THEORETICAL AND EXPERIMENTAL STUDY OF THE NONISOTHERMAL BURN UP RATES OF GRAPHITE SURFACES IN AN AIR FLOW WITH OR WITHOUT INJECTING A NEUTRAL GAS INTO THE BOUNDARY LAYER AS A SHIELD FROM BURNING. THE EXPERIMENTS WERE CARRIED OUT AT TEMPERATURES FROM 1500 TO 1800DEGREESC AT REYNOLDS NUMBERS FROM 40K TO 4M IN A GRAPHITE CHANNEL. THE CHANNEL WALLS WERE 5-10 MM THICK, THE DENSITY OF THE GRAPHITE SPECIMENS WAS 1076-1925 KG-CU M, AND NITROGEN OR ARGON WERE INJECTED THROUGH SLOTS FOR SHIELDING. THE GRAPHITE BURN UP RATES WERE ESTIMATED BY MEASURING THE CHANNEL DIAMETER AFTER EXPERIMENTS. EQUATIONS ARE PROPOSED FOR ESTIMATING THE EFFECTIVENESS OF THIS SHIELDING TECHNIQUE. THE THEORETICAL AND EXPERIMENTAL RESULTS ARE COMPARED. FACILITY: AKADEMIYA NAUK SSSR, NAUCHNO-ISSLEDOVATEL'SKII INSTITUT VYSOKIKH TEMPERATUR, MOSCOW, USSR.
